

HEALTHCARE IS SWIMMING IN PLASTIC WASTE

**THE TIDE IS
CHANGING
WITH CACHE**

Staff in hospitals around the world are working hard to maintain safe environments for their patients, by cleaning and disinfecting surfaces. For years, pre-wetted wipes have been the go-to product.

The uncomfortable truth is that most pre-wetted wipes are made entirely from plastic.

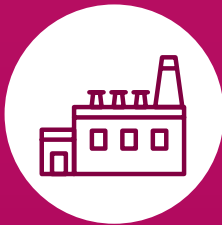

Putting this into perspective, the UK National Health Service (NHS) has been known to use over 400 tons of plastic wipes in just one year. That amount of plastic is heavier than 4 blue whales.

Its not just the use of plastic wipes that does harm, but the manufacturing, shipping, storage and disposal of them too.

We can clear up the problem with Cache.

Cache products stand out from the crowd. By separating the solution from the wipe, we avoid so many harmful consequences.

When you have control over the solution, you can choose non-plastic wipes and use fewer of them. Small capsules filled with concentrate chemistry reduces the amount of material, space and emissions needed to make, store and deliver them. Coupled with our reusable and recyclable components, we are turning the tide for sustainability in healthcare.

RECYCLE

Let's address the blue whale in the room: **biodegradability.**

Biodegradability only matters when a wipe is being thrown into a landfill. Do claims like these mean anything when the wipes used in healthcare are mostly being incinerated?

Cache products deliver genuine sustainability, designed with healthcare in mind.
